

DAY 4 ASSIGNMENT

1. Open your own laptop or desktop (or use an online PC hardware simulator if you don't have access to a real system) and identify the GPU model installed. Write down the GPU's brand, model number, and whether it is integrated or dedicated.

Feature	Details
GPU Brand	Intel
GPU Model Number	Intel UHD Graphics 620
GPU Type	Integrated GPU

Description:

Intel UHD Graphics 620 is an integrated graphics processor built into Intel CPUs. It shares system memory and is suitable for everyday tasks, video playback, and light gaming

2. Take a clear photo or screenshot of the cooling system (fan, heatsink, or liquid cooling setup) inside your PC or from a PC hardware simulator. Label the main cooling components

3. Create a comparison table listing at least 3 differences between air cooling and liquid cooling systems for GPUs, including factors like cost, efficiency, and maintenance.

Factor	Air Cooling	Liquid Cooling
Cost	Less expensive	More expensive
Cooling Efficiency	Good for most systems	Better for high-performance systems
Maintenance	Very low maintenance	Requires periodic maintenance
Installation	Easy to install	More complex installation
Noise Level	Can be noisier at high speeds	Usually quieter

4. Imagine you are building a gaming PC for streaming IPL matches and playing graphics-heavy games. Choose between air cooling and liquid cooling for your GPU, and justify your choice in 3-4 sentences based on your research.

For a gaming PC used for streaming IPL matches and playing graphics-heavy games, I would choose **liquid cooling** for the GPU. Liquid cooling provides better heat dissipation, helping the GPU maintain stable performance during long gaming and streaming sessions. It also operates more quietly than many air coolers under heavy loads. Although it costs more, the improved cooling efficiency makes it a good choice for a high-performance gaming PC.
