

DAY 5 ASSIGNMENT

1. List all the main components you find inside a desktop PC after opening the cabinet, and write a short description (1-2 lines) for each.

Component	Short Description
Motherboard	The main circuit board that connects all computer components and allows them to communicate.
CPU (Processor)	The brain of the computer that processes instructions and performs calculations.
RAM (Random Access Memory)	Temporary memory used by the computer to run programs and store active data.
HDD (Hard Disk Drive)	A storage device used to permanently store files, software, and the operating system.
SSD (Solid State Drive)	A faster storage device that stores data and improves system performance.
Power Supply Unit (PSU)	Converts AC power from the wall outlet into DC power for computer components.
CPU Cooler (Fan & Heatsink)	Removes heat from the CPU to keep it running at safe temperatures.
Graphics Card (GPU)	Processes graphics, videos, and gaming visuals for display on the monitor.
Optical Drive (Optional)	Reads and writes CDs, DVDs, or Blu-ray discs.
Expansion Cards	Add extra features such as Wi-Fi, sound, or additional USB ports.
SATA/Data Cables	Connect storage devices to the motherboard for data transfer.
Computer Case (Cabinet)	Holds and protects all internal computer components.

4. Create a checklist of safety precautions and tools needed before starting the PC assembly/disassembly process, and explain why each is important.

Tool	Why It Is Important
Phillips Screwdriver	Used to remove and tighten screws inside the PC.
Anti-Static Wrist Strap	Prevents electrostatic discharge (ESD) that can damage components.
Flashlight	Helps see small connectors and components inside the cabinet.
Small Container for Screws	Keeps screws organized and prevents them from getting lost.
Soft Cleaning Brush	Removes dust from components safely.
